WO 2004/033415 A1

AP20Rsc'd PCT/PTO 25 APR 2006

NITROANILINE-BASED ALKYLATING AGENTS  
AND THEIR USE AS PRODRUGS

The present invention relates to the preparation of nitroaniline-based unsymmetrical  
5 mustards, and their use as prodrugs for GDEPT (gene-dependent enzyme-prodrug therapy)  
and cell ablation therapy in conjunction with nitroreductase enzymes, as hypoxia-selective  
cytotoxins, and as anticancer agents.

BACKGROUND TO THE INVENTION

10

The use of tumour-selective prodrugs (relatively inactive compounds that can be  
selectively converted to more active compounds *in vivo*) is a valuable concept in cancer  
therapy.

15

For example a prodrug may be converted into an anti-tumour agent under the influence  
of an enzyme that is linkable to a monoclonal antibody that will bind to a tumour  
associated antigen. The combination of such a prodrug with such an enzyme  
monoclonal/antibody conjugate represents a very powerful clinical agent. This  
approach to cancer therapy, often referred to as "antibody directed enzyme/prodrug  
20 therapy" (ADEPT), is disclosed in W088/07378.

25

A further therapeutic approach termed "virus-directed enzyme prodrug therapy"  
(VDEPT) has been proposed as a method for treating tumour cells in patients using  
prodrugs. Tumour cells are targeted with a viral vector carrying a gene encoding an  
enzyme capable of activating a prodrug. The gene may be transcriptionally regulated  
by tissue specific promoter or enhancer sequences. The viral vector enters tumour cells  
and expresses the enzyme, in order that a prodrug is converted to an active drug within  
the tumour cells (Huber et al., *Proc. Natl. Acad. Sci. USA* (1991) 88, 8039).

30

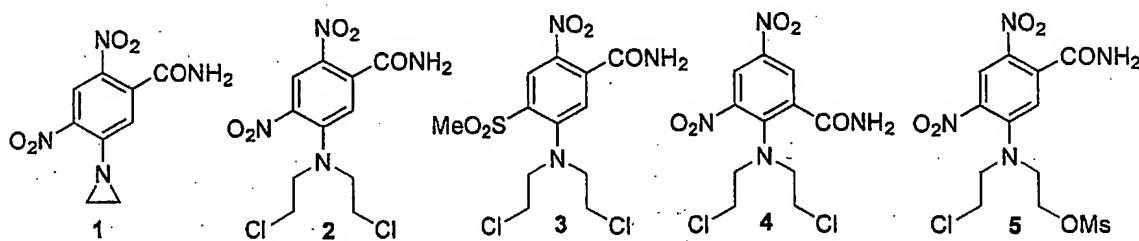

Alternatively, non-viral methods for the delivery of genes have been used. Such  
methods include calcium phosphate co-precipitation, microinjection, liposomes, direct  
DNA uptake, and receptor-mediated DNA transfer. These are reviewed in Morgan &  
French, *Annu. Rev. Biochem.*, 1993, 62; 191. The term "GDEPT" (gene-directed  
enzyme prodrug therapy) is used to include both viral and non-viral delivery systems.

4-Nitroaromatic compounds are reduced by both mammalian and bacterial flavoprotein enzymes, which effect stepwise addition of up to six electrons. The major enzymic metabolite is usually the 4-electron species (hydroxylamine):

5

The present invention relates to novel nitroaniline-based unsymmetrical mustards having cytotoxic activity, to methods of preparing the novel compounds, and to the use of these compounds as prodrugs for GDEPT and for cell ablation therapy in conjunction with nitroreductase enzymes (particularly the nitro reductases encoded by the nfsB gene of 10 *E. coli* or by *Clostridia* species), as hypoxia-selective cytotoxins, and as anticancer agents.

Both dinitrobenzamide aziridines (e.g., 1) [Knox et al., *Cancer Met. Rev.*, 1993, 12, 195] and nitro- and dinitrobenzamide mustards (e.g., 2-4) [Friedlos et al., *J. Med. Chem.*, 1997, 15 40, 1270] have been reported as substrates for the aerobic *E. coli* nitroreductase (NTR), and as specific prodrugs for GDEPT in conjunction with NTR.

20

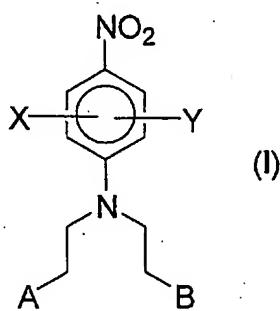

Unsymmetrical (chloro-mesylate) mustards have been reported [e.g., Marais et al., *Cancer Res.* 1996, 56, 4735], including the dinitro analogue 5 [Friedlos et al., *J. Med. Chem.* 1997, 40, 1270], which was described as not sufficiently potent for a full biological evaluation to be conducted.

25

It is therefore an object of the invention to provide a series of unsymmetrical mustards, methods for preparing the unsymmetrical mustards that are suitable for use as prodrugs for GDEPT (gene-dependent enzyme-prodrug therapy) and cell ablation therapy in conjunction with nitroreductase enzymes, as hypoxia-selective cytotoxins, and as 30 anticancer agents or to at least provide the public with a useful alternative.

The precise nature of the carrier or other material will depend on the route of administration, which may be oral, or by injection, such as cutaneous, subcutaneous, or intravenous. It is to be appreciated that these factors could be readily determined by  
20 someone skilled in the art without undue experimentation.

Pharmaceutical compositions for oral administration may be in tablet, capsule, powder or liquid form. A tablet may comprise a solid carrier or an adjuvant. A capsule may comprise a solid carrier such as gelatin.  
25

30 For intravenous, cutaneous or subcutaneous injection, the active ingredient will be in the form of a parenterally acceptable aqueous solution which is pyrogen-free and has a suitable pH, isotonicity and stability. Those of relevant skill in the art are well able to prepare suitable solutions using, for example, isotonic vehicles such as Sodium

Chloride injection, Ringer's injection, Lactated Ringer's injection. Preservatives, stabilisers, buffers antioxidants and/or other additives may be included as required.

In a ninth aspect of the present invention there is provided, the use in the manufacture

As used throughout the specification the term "therapeutically effective amount", is to be  
20 understood as an amount of a compound of Formula I as defined above or a compound of any one of compounds Ia-c, IIa-c and IIIa-c as defined above or a mixture thereof that is sufficient to show benefit to a subject with cancer cells. The actual amount, rate and time-course of administration, will depend on the nature and severity of the disease being treated. Prescription of treatment is within the responsibility of general practitioners and  
25 other medical doctors.

It is to be understood that the compounds of the invention as defined above may be administered alone or in combination with other treatments, especially radiotherapy, either simultaneously or sequentially dependent upon the condition to be treated.

methanesulfonic, isethionic acids and the like and base derived salts formed from sodium and potassium carbonate, sodium and potassium hydroxide, ammonia, triethylamine, triethanolamine and the like.

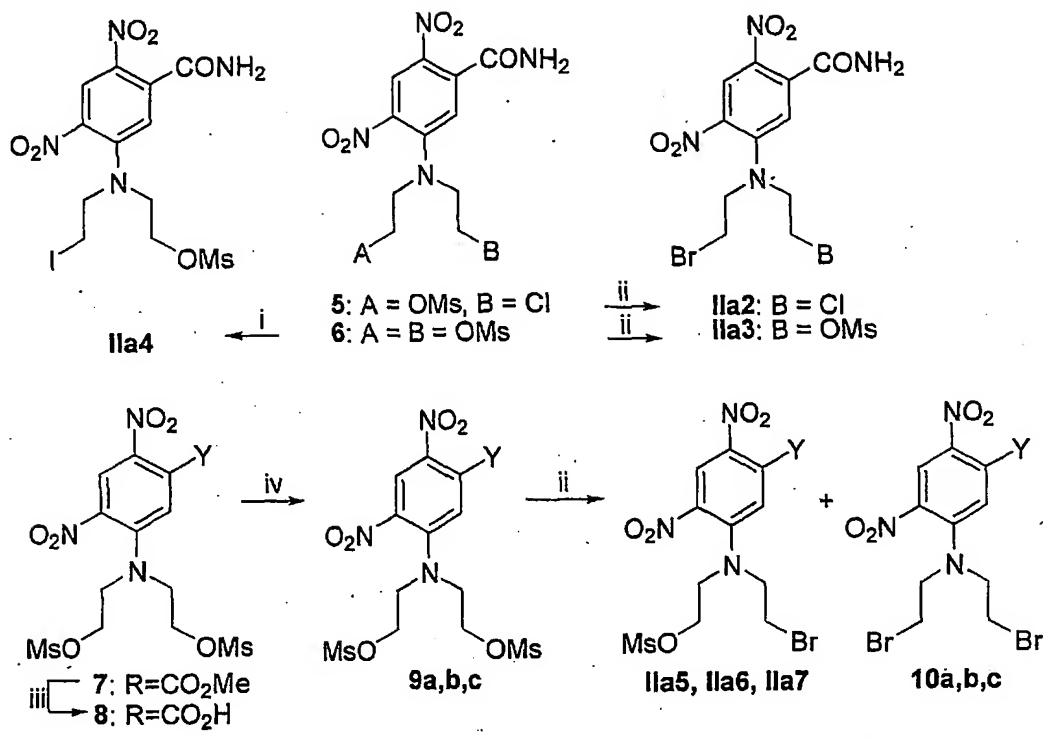

5 The technique of cell ablation therapy, would be known to someone skilled in the art. This therapy can be used to selectively ablate specified target cells or tissue through specific enzymatic expression of a nitroreductase for example, that is specifically expressed by the tissue and which can then be employed to active a prodrug into an active metabolite to ablate the specified target cells or tissue. (*Gusterson et al. Endocrine Related Cancer*,  
10 1997, 4, 67-74.)

The expression "substantially minimal bystander effect" is to be understood as meaning that the killing of adjoining non-targeted tumour cells is minimal as a result of diffusion between the targeted tumour cells and non-targeted tumour cells of an activated metabolite  
15 that arises from the enzymatic activation of a compound of Formula I as defined above or a compound of any one of compounds Ia-c, IIa-c and IIIa-c as defined above or a mixture thereof.

Further aspects of the present invention will become apparent from the following  
20 description given by way of example only and with reference to the accompanying synthetic schemes.

In Schemes 1-3, the key reaction is reaction of the dimesylates 6, 9, 13a-13g and 18a-18d with strictly controlled amounts of LiBr or NaI in a polar solvent like DMF or MeCN to give the unsymmetrical bromo- and iodo-mesylate mustards. The method can also be adapted to reaction of the known chloromesylate (5) to give the unsymmetrical chloro/bromo mustard IIa2. While this reaction gives varying amounts of the corresponding bis(bromo) or bis(iodo) compounds as well, these can be easily separated by chromatography to give the pure unsymmetrical mustards.

Compounds of formula I wherein X represents  $\text{SO}_2\text{Me}$ , Y represents  $\text{CONR}^2\text{R}^3$ , and A and B each independently represent halogen or  $\text{OSO}_2\text{R}^4$  (with the proviso that A  $\neq$  B) can be prepared by the general route outlined (for a specific example) in Scheme 4, from 3,4-difluorobenzonitrile [after Atwell et al., *Anti-Cancer Drug Design*, 1996, 11, 553-567]. Reaction of this with NaSMe followed by oxidation provides the  $\text{SO}_2\text{Me}$

group, and the nitrile is then elaborated to the  $\text{CONR}^2\text{R}^3$  function. Displacement of the 4-F group with diethanolamine, followed by elaboration, gives the required asymmetric mustards.

Compounds of formula I wherein X represents CN, Y represents  $\text{CONR}^2\text{R}^3$ , and A and B each independently represent halogen or OSO<sub>2</sub>R<sup>4</sup> (with the proviso that A ≠ B) can be prepared by the general route outlined (as shown for a specific example) in Scheme 10 5, from 3,4-difluorobenzonitrile [after Atwell et al., *Anti-Cancer Drug Design*, 1996, 11, 553-567]. Conversion of the nitrile to a carboxamide (hydrolysis followed by amination), then displacement of the 3-F with TMS-CN, followed by reaction of the 4-F group with diethanolamine and subsequent elaboration as in Scheme 4 gives the required asymmetric mustard.

Compounds of formula I wherein X represents NO<sub>2</sub>, Y represents NHCOR<sup>2</sup>, and A and B each independently represent halogen or OSO<sub>2</sub>R<sup>4</sup> (with the proviso that A ≠ B) can be prepared by the general route outlined (as shown for a specific example) in Scheme 20 20, from 3,4-difluorobenzonitroso compound [after Atwell et al., *Anti-Cancer Drug Design*, 1996, 11, 553-567].

Reaction of the more active 1-Cl group with NaOMe gives the methyl ether, and subsequent elaboration of the 5-Cl group as in Scheme 4 gives the required asymmetric mustard.

Methyl 3-{[2-((2-chloroethyl){2-[(methylsulfonyl)oxy]ethyl}amino)-3,5-dinitrobenzoyl]amino}propanoate (IIb8). Methyl alanine hydrochloride (2.55 g, 18.3 mmol) was dissolved in water (12 mL), and the solution was diluted with Me<sub>2</sub>CO (20 mL) and Et<sub>2</sub>O (50 mL).
